

UBC ELEC 221: Introduction to Signals and Systems

Continuous Time Signals

Even and Odd Components

$$x_{\text{even}}(t) = \frac{1}{2}[x(t) + x(-t)]$$

$$x_{\text{odd}}(t) = \frac{1}{2}[x(t) - x(-t)]$$

Periodicity

$$x(t + kT_0) = x(t) \forall t \in (-\infty, \infty)$$

Energy

$$E = \int_{-\infty}^{\infty} |x(t)|^2 dt$$

Power

$$P = \lim_{T \rightarrow \infty} \frac{1}{2T} \int_{-T}^T |x(t)|^2 dt$$

Causality:

- Causal: $x(t) = 0$ for $t < 0$.
- Anti-Causal: $x(t) = 0$ for $t \geq 0$.
- Acausal or Non-Causal: Both of the above.

Continuous Time Systems

Linearity

$$\mathcal{S}[\alpha x(t) + \beta y(t)] = \alpha \mathcal{S}[x(t)] + \beta \mathcal{S}[y(t)]$$

Time Invariance

$$\mathcal{S}[x(t)] = y(t) \Rightarrow \mathcal{S}[x(t \pm \tau)] = y(t \pm \tau)$$

Zero-State Response. Due to the input as the initial conditions are zero.

Zero-Input Response. Due to the initial conditions as the input is zero.

Convolution

$$y(t) = \int_{-\infty}^{\infty} x(\tau)h(t - \tau) d\tau = \int_{-\infty}^{\infty} x(t - \tau)h(\tau) d\tau$$

Causality. A continuous time system $\mathcal{S}$ is causal if whenever $x(t) = 0$ and there are no initial conditions, $y(t) = 0$ and the output $y(t)$ does not depend on future inputs. **BIBO Stability.** If an input bounded then the output of a BIBO stable system is bounded.

$$\Leftrightarrow \int_{-\infty}^{\infty} |h(t)| dt < \infty$$

Laplace Transform

Eigenfunction Property

$$\mathcal{S}[e^{s_0 t}] = H(s_0)e^{s_0 t}$$

One Sided Laplace Transform:

$$F(s) = \mathcal{L}[f(t)u(t)] = \int_{0^-}^{\infty} f(t)e^{-st} dt, \forall s = \sigma + j\omega$$

Note: $|H(s)|$ is greatest when s is closest to the poles.

Signal Support

Finite support

Causal function

Anti-causal

Non-causal

ROC

Entire s-plane.

$\sigma > \max(\sigma_i), -\infty < \omega < \infty$

$\sigma < \min(\sigma_i), -\infty < \omega < \infty$

$\mathcal{R} = \mathcal{R}_{\text{causal}} \cap \mathcal{R}_{\text{anti-causal}}$

Initial Value Theorem

$$f(0^+) = \lim_{s \rightarrow \infty} sF(s)$$

Final Value Theorem

$$\lim_{t \rightarrow \infty} f(t) = \lim_{s \rightarrow 0} sF(s)$$

BIBO Stability. If the region of convergence contains the $j\omega$ -axis then the system is BIBO stable.

2-Sided LT from 1-Sided LT

- For an anti-causal function $C(s) = \mathcal{L}[c(-t)u(t)]_{(-s)}$

- For a 2-sided function

$$p(t) = p_{ac}(t) + p_c(t) = p(t)u(-t) + p(t)u(t)$$

- $P(t) = \mathcal{L}[p_{ac}(-t)u(t)]_{(-s)} + \mathcal{L}[p_c(t)u(t)]$

Fourier Series

Eigenfunction Property

$$\mathcal{S}[e^{j\omega_0 t}] = H(j\omega_0)e^{j\omega_0 t}$$

$$x(t) = \sum_k X_k e^{j\omega_k t}$$

$$\Rightarrow y(t) = \sum_k X_k H(j\omega_k) e^{j\omega_k t}$$

$$= \sum_k X_k |H(j\omega_k)| e^{j(\omega_k t + \angle H(\omega_k))}$$

Fourier Series Coefficients (for any t_0)

$$X_k = \frac{1}{T_0} \int_{t_0}^{t_0+T_0} x(t) e^{-jk\omega_0 t} dt$$

Parseval's Power Relation (for any t_0):

$$P = \frac{1}{T_0} \int_{t_0}^{t_0+T_0} |x(t)|^2 dt = \sum_{k=-\infty}^{\infty} |X_k|^2$$

Symmetry of Line Spectra:

$$|X_k| = |X_{-k}|$$

$$\angle X_k = -\angle X_{-k}$$

Trigonometric Fourier Series:

$$x(t) = X_0 + 2 \sum_{k=1}^{\infty} |X_k| \cos(k\omega t + \Theta_k)$$

$$x(t) = c_0 + 2 \sum_{k=1}^{\infty} [c_k \cos(k\omega_0 t) + d_k \sin(k\omega_0 t)]$$

$$c_k = \frac{1}{T_0} \int_{t_0}^{t_0+T_0} x(t) \cos(k\omega_0 t) dt \quad k = 0, 1, 2, \dots$$

$$d_k = \frac{1}{T_0} \int_{t_0}^{t_0+T_0} x(t) \sin(k\omega_0 t) dt \quad k = 1, 2, 3, \dots$$

$$\Theta_k = -\arctan(d_k/c_k)$$

Fourier Coefficients from Laplace Transform. If $x_1(t)$ is a single period of $x(t)$, then

$$X_k = \frac{1}{T_0} \mathcal{L}[x_1(t)] \Big|_{s=jk\omega_0}$$

Response of LTI Systems to Periodic Signals. If the input to an LTI system has Fourier Series

$x(t) = X_0 + 2 \sum_{k=1}^{\infty} |X_k| \cos(k\omega t + \angle X_k)$, then the steady state response is

$$y(t) = X_0 |H(j0)| + 2 \sum_{k=1}^{\infty} |X_k| |H(jk\omega_0)| \cos(k\omega_0 t + \angle X_k + \angle H(jk\omega_0))$$

Fourier Transform

$$X(\omega) = \int_{-\infty}^{\infty} x(t) e^{-j\omega t} dt$$

Inverse Fourier Transform

$$x(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(\omega) e^{j\omega t} d\omega$$

Fourier Transform from Laplace Transform (if $X(s)$ contains the $j\omega$ -axis),

$$\mathcal{F}[x(t)] = \mathcal{L}[x(t)] \Big|_{s=j\omega} = X(s) \Big|_{s=j\omega}$$

Fourier Transform of Periodic Signals under Fourier Series

$$\sum_k X_k e^{jk\omega_0 t} \Leftrightarrow \sum_k 2\pi X_k \delta(\omega - k\omega_0)$$

Parseval's Energy Relation

$$E = \int_{-\infty}^{\infty} |x(t)|^2 dt = \frac{1}{2\pi} \int_{-\infty}^{\infty} |X(\omega)|^2 d\omega$$

Sampling Theory

$$x_s(t) = x(nT_s) = x(t)|_{t=nT_s} = x(t) \sum_n \delta(t - nT_s)$$

$$X_s(\omega) = \frac{1}{T_s} \sum_{k=-\infty}^{\infty} X(\omega - k\omega_s)$$

Nyquist-Shannon Sampling Rate

$$\omega_s = \frac{2\pi}{T_s} \geq 2\omega_{\max}$$

Aliasing occurs if $\omega_s < 2\omega_{\max}$

Reconstruction $X(\omega) = X_s(\omega)H_{\text{lp}}(\omega)$:

$$H_{\text{lp}}(\omega) = \begin{cases} T_s & -\frac{\omega_s}{2} \leq \omega \leq \frac{\omega_s}{2} \\ 0 & \text{otherwise} \end{cases}$$

Inclusive bounds. If represented by a unit step function the bounds are inclusive for filters

Signal Reconstruction from Sinc Interpolation

$$x_r(t) = \sum_{n=-\infty}^{\infty} x(nT_s) \frac{\sin(\pi(t - nT_s)/T_s)}{\pi(t - nT_s)/T_s}$$

Discrete Time Signals

Definition $x[n] = x(nT_0)$.

$$x[n] = \sum_{k=-\infty}^{\infty} x[k]\delta[n - k]$$

Periodicity

$$x[n + kN] = x[n] \quad \forall k \in \mathbb{Z}$$

When sampling an analog sinusoid of fundamental period T_0 , we obtain a periodic discrete sinusoid provided that m, N not divisible by each-other,

$$\frac{T_s}{T_0} = \frac{m}{N}$$

Aliasing occurs if

$$T_s > T_0/2$$

Energy

$$E = \sum_{n=-\infty}^{\infty} |x[n]|^2$$

Power

$$P_x = \lim_{N \rightarrow \infty} \frac{1}{2N+1} \sum_{n=-N}^N |x[n]|^2$$

Convolution

$$y[n] = \sum_{k=-\infty}^{\infty} x[k]h[n - k]$$

Bounded-Input Bounded-Output Stability

$$\sum_{n=-\infty}^{\infty} |h[n]| < \infty$$

Z-Transform

$$\mathcal{Z}[x(nT_s)] = \mathcal{L}[x_s(t)]|_{z=e^{sT_s}} = \sum_n x(nT_s)z^{-n}$$

Convergence

$$|X(z)| = \sum_n |x[n]|r^{-n} < \infty$$

Initial Value Theorem

$$x[0] = \lim_{z \rightarrow \infty} X(z)$$

Final Value Theorem:

$$\lim_{n \rightarrow \infty} x[n] = \lim_{z \rightarrow 1} (z - 1)X(z)$$

BIBO Stability. If the ROC contains radius $z = 1$, then the system is BIBO stable.
